

WHY ARE WE ASKING YOU TO MAKE ONE BOTTLE AT A TIME?

- Infants and young children are especially sensitive to tummy bugs.
- Powdered milk is NOT sterile.
- Studies have shown that contamination of powdered milk with E.Sakazakii and Salmonella have been a cause of infection in infants and young children.
- In severe cases it can cause problems of the central nervous system and/or death.
- The guidelines for preparing formula milk came about because these organisms can grow and multiply depending on how formula is prepared and stored. To decrease the risk of your baby contracting these infections we ask that you follow these Food Standards Agency guidelines.
